Brilliant Book despite lacking cranial bones.

By Lamb and Martyr

This is an excellent book. Despite a complete lack of cranial bones. It does cover them in writing with a small section of horn vs antlers and a few illustrations of cranial sutures. Some very nice descriptions about the bones that compare and contrast features that make it easy to understand differences to make identification. Each bone is described and contrasted by overall size and proportions, Shaft sections, proximal and distal ends. Tubercles, condyles, articulations. Makes ID very easy. Lots of dentition! Boneheads unite! ;-)

4 of 4 people found the following review helpful.

Illustrated manual for British and European Zooarchaeology

By Katherine Moore Hiebert

This is a nicely designed book aimed at supporting lab work in zooarchaeology. The body of the book is illustrations of skeletal elements and articular surfaces of major European domesticates and several wild mammal species (deer and bear). The illustrations of teeth match the ones found in Teeth by the same author. It is best suited for Britain but the author suggests ways that it could be adapted for use in North America. Despite title "Guide to methods" there is very little text or methodological guidance (about understanding

characters and variation, sampling, taphonomy, recording, interpretation). I recommend it for students (who must also have access to a comparative collection) based on its clear illustration, helpful labels, and lay-flat binding.
